

Homework

Assignment descriptions and student submissions for homework involving coding

Downloading Assignment Materials

When the assignment is released, you can **pull** the needed materials (HW description and any materials, such as code templates), using git:

1. Fork this repository: In the upper right corner of this page, there is a button labeled ‘fork.’ Clicking this will create a copy of this ‘Homework’ repository in your personal GitHub page.
2. Clone your repository: on your machine (either using a terminal/command line or the Git Desktop GUI), clone your repository:

```
git clone <repo address>
```

where is the address to the forked repository (click the green ‘Code’ button on the repo’s home page).

This downloads a copy of this repository, but also creates a link to your github page. In git parlance, this link establishes your page as a ‘remote’ that your code connects to. Because you cloned from this particular remote, it considers your page the ‘origin.’

3. Add this repository as a remote (I name it `class`, below, but call it whatever you like):

```
git remote add class https://github.com/Echem-Systems-Engineering-Fall2020/Homework.git
```
